4. OBJECTIVES

This plan addresses Phosphorous (total), Sulphuric acid, and Nitric acid, which are used at the facility as part of the aluminum anodizing process. Phosphorous (total), Sulphuric acid, and Nitric acid are key components in the anodizing process, and exist in quantities necessary to attain the customer-driven quality of finish.

Dajcor performs Type II aluminum anodizing which refers to coatings of moderate thickness, 1.8µm to 25µm. Anodizing thickness increases wear resistance, corrosion resistance, ability to retain lubricants and PTFE coatings, and electrical and thermal insulation. Dajcor's commitment to continuous improvement has resulted in an efficient finishing operation. The facility's continuous improvement measures, coupled with the acknowledgment that the customer provides the specifications for the finishes to be achieved at the site mean that there are no options for the facility to implement.

5. PROGRESS IN IMPLEMENTING PLAN

This section does not apply since no feasible reduction options have been identified for implementation at this time.

5.1 Statement of Compliance:

For information on on-site releases from the facility, please refer to National Pollutant Release Inventory's website: http://www.ec.gc.ca/inrp-npri/.

As of CT 12, Mike Kilby, certify that I have read the reports on the toxic substance reduction plans for the toxic substances referred to below and am familiar with their contents, and to my knowledge the information contained in the reports is factually accurate and the reports conform with the Toxics Reduction Act, 2009 and Ontario Regulation 455/09 (General) made under that Act.

Phosphorus (total), (NA - 22)

Sulphuric acid, (7664-93-9) and

Nitric acid, (7697-37-2)
